Universal Healthcare?

0

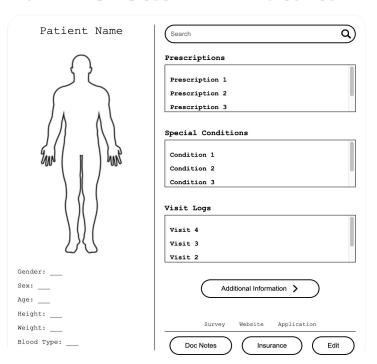

Why is it important?

- Equity in access
- Preventive care
- Cost Efficiency
- Healthier populations

Universal EMR Card

- Patient information, prescriptions, and medical history
 - Self-reported data is flagged pending verification via healthcare provider

Visit Logs +	

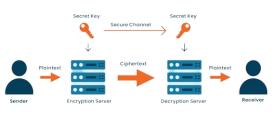

- Dual-portal interface
- Patient information is secure, immutable, and transparent

Blockchain

- Why blockchain? Blockchain can be used as a standardized secure list or "chain" of visits which can be used to verify information
- With LinkID, each visit information would be stored in a "block" and <u>a chain of these blocks (a blockchain)</u> would be made for each user
- The LinkID blockchain system secures each patient's records using <u>AES (Advanced Encryption Standard)</u> encryption
- Private keys and unique IDs are generated for each chain to ensure that only medical professionals and patients can access the data.

AES Algorithm Working

The LinkID Blockchain System (AES Breakdown)

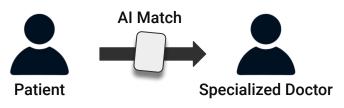

- obtained form the JSON using a corresponding private key pair
- The private key and a generated ID is given to the healthcare provider and the patient
- The system will only be able to unlock the encrypted JSON records if the private key entered for a record is correct
